

◆ Title

Replace Employee ID With The Unique Identifier

◆ Basic Idea

You are given two tables:

- One table has **all employees**
- Another table has **unique IDs for some employees**

Your task is to:

- Show **each employee's name**
 - Show their **unique ID if it exists**
 - If an employee **does not have a unique ID**, display **NULL**
-

◆ Tables Explanation

Employees

Column	Description
id	Employee ID (Primary Key)
name	Employee name

This table contains **all employees**.

EmployeeUNI

Column	Description
id	Employee ID
unique_id	Unique identifier

This table contains **unique IDs for some employees only**.

◆ Key Concept Used

LEFT JOIN

Why?

- We want **all employees** from the `Employees` table
- Even if they **don't have a matching row** in `EmployeeUNI`
- Missing matches should return **NULL**

◆ SQL Solution

```
select unique_id, name
from Employees e
left join EmployeeUNI ee
on e.id = ee.id
```

◆ Explanation (Step-by-Step)

1. `FROM Employees e`
→ Start with all employees (main table)
2. `LEFT JOIN EmployeeUNI ee`
→ Try to match each employee with their unique ID
3. `ON e.id = ee.id`
→ Join condition based on employee ID
4. `SELECT ee.unique_id, e.name`
→ Show:
 - `unique_id` if available
 - `NULL` if not available (automatic with LEFT JOIN)

◆ Example Output Logic

Employee Has Unique ID? Result

Alice	✗ No	NULL
Bob	✗ No	NULL
Meir	✓ Yes	2
Winston	✓ Yes	3
Jonathan	✓ Yes	1

◆ **One-Line Answer**

“Use a LEFT JOIN to keep all employees and return NULL for those without a unique ID.”
